

FROM Public Relations Office
The University of Toledo

August 28, 1958

TO Special to Mitch Woodbury

Dr. William S. Carlson, a geologist as well as a university administrator, should feel right at home when he moves into the president's office at the University of Toledo, Sept. 2.

Set into the mantle of the fireplace behind his desk are the fossilized remains of two prehistoric mollusks each nearly a foot long, which are estimated to be 175 million years old. They were discovered in a block of stone being quarried for the construction of University Hall in 1930.
